Self-localization of Mobile Robot Based on Binocular Camera and Unscented Kalman Filter
Abstract - Self-localization is a fundamental requirement for a mobile robot. In indoor environments, the objects are polygonal usually. These objects can be described as line segments. Depth image of the environment can be obtained ...

Scalable SLAM building conditionally independent local maps
Abstract— Local maps algorithms have demonstrated to be well suited for mapping large environments as can reduce the computational cost and improve the consistency of the final estimation. In this paper we present a new ...
